RECORDLY

Kemira's first 100 days in data and AI

A prioritised, costed roadmap on SAP S/4HANA, Datasphere, SAC and Azure, with first value delivered inside the 100 days

Proposal to Rasmus Vuorinen, Director of Digital Analytics · Recordly Oy · Helsinki

The proposal in one page

Outcome	A 100-day plan the Digital Analytics team can execute: 3–5 prioritised AI and data use cases with business cases, the platform moves they need on SAP and Azure, and a team capability plan
Quick win	One use case taken to a working proof of value on real Kemira data **by day 60**, so the roadmap starts with evidence
Approach	Four phases over 12 weeks, built on what Kemira already runs. No new platform, no new licences.
Team	Two senior people doing the work themselves, available from contract signature, plus an SAP architect on call
Price	**€16,500 fixed total**
Contract	No contractual deviations

> Designed to cost your team **as little time as possible**: about 2 hours a week from you, a few targeted interviews, and no recurring status meetings. Written updates instead.

What we understand

BACKGROUND

- Kemira serves **water treatment and process industry customers globally**; operational efficiency, chemical dosing, supply reliability and sustainability reporting drive value
- The data foundation is in place: **SAP S/4HANA** for operations, **SAP Datasphere** for the semantic layer, **SAP Analytics Cloud** for reporting, **Microsoft Azure** for advanced analytics and AI
- The Digital Analytics team needs a **clear first 100 days**: where to focus, what to stop, and what to show leadership early

YOUR AIMS

- **Immediate, high-impact milestones**, not a long strategy document
- **AI use cases that are prioritised by value and feasibility** on the existing SAP + Azure stack
- **Defined team capabilities**: what to build internally, what to buy, what to source
- A roadmap the team can run **without heroics or overtime**

Approach: four phases, twelve weeks

PHASE	WEEKS	WHAT HAPPENS	DELIVERABLE
1 • Baseline	1–2	Review existing SAP, Datasphere, SAC and Azure setup and backlog; 8–10 focused interviews (45 min each)	Current-state snapshot (5 pages)
2 • Use case sprint	3–5	Long-list of 20–30 opportunities across supply chain, production and commercial analytics; scored on value, data readiness and effort	Ranked use-case portfolio with business cases for the top 5
3 • Proof of value	5–9	Top use case built on real data in Azure, using Datasphere as the governed source	Working proof of value with measured results, **by day 60**
4 • 100-day roadmap	9–12	Sequenced plan, platform enablers, team capability and sourcing plan, KPIs	Roadmap, capability plan, leadership presentation

Data governance built into the roadmap, not left vague

AREA	WHAT THE ROADMAP FIXES, CONCRETELY
Ownership	A named business owner and data steward for every dataset the prioritised use cases depend on (S/4HANA material, plant, batch, customer)
Single governed source	SAP Datasphere is the governed layer; Azure AI work reads only from certified Datasphere views, so there are no shadow copies
Data quality rules	Measurable rules per critical field (completeness, validity, timeliness), automated checks and a visible quality score in SAC
Downstream access control	Access to every SAC story, Datasphere space and Azure output is **role-based and inherited from SAP authorisations**: row-level security by plant, region and business unit; no direct table access for consumers; sensitive data classified and masked before any AI use; **quarterly access reviews** signed off by data owners; every access logged
Definitions	One business glossary for KPIs (e.g. dosing per m^3, OTIF, yield) shared across SAC and Azure
Decision rights	A light data council: monthly, 45 minutes, decisions logged, owned by Digital Analytics

Each governance item is tied to a use case, so governance work always serves a result.

How it works on real data, not slides

Example: proof of value for chemical dosing optimisation (if it ranks first)

STEP	WEEK	WHAT WE ACTUALLY DO WITH YOUR DATA
1 • Pull	5	Read dosing set-points, flow, turbidity and lab results for one plant from Datasphere into Azure (no new tools, governed source)
2 • Face the mess	5–6	Profile gaps, sensor drift, unit mismatches and manual lab entries. Every issue logged with its row count, and **shown to your team, not hidden**
3 • Baseline	6	Measure today's dosing per m^3 against water-quality outcomes, and agree the baseline with plant staff
4 • Model	7–8	Simple, explainable model first (regression or gradient boosting) recommending dosing within safe limits
5 • Prove	9	Back-test on 6–12 months of history: chemical saved per m^3 at equal quality, and where the model fails
6 • Decide	9	Go/no-go on scaling, with numbers on the table and code in your repo

> Each week you get a short written note with real charts from your data. If the data can't support the use case, you hear it in week 6, not in month 6.

Key deliverables

#	DELIVERABLE	FORMAT
D1	Current-state snapshot of data, platform and team	5-page document
D2	Scored use-case portfolio with business cases for the top 5	Workbook + 10-page summary
D3	Working proof of value for the top use case on real data	Code in Kemira's Azure repo + results memo
D4	Target architecture moves on SAP Datasphere, SAC and Azure (only what the use cases need)	Architecture note
D5	Team capability and sourcing plan: roles, skills, build/buy/partner	Plan + role descriptions
D6	100-day roadmap with milestones, owners, KPIs and budget	Roadmap + leadership presentation

All deliverables are Kemira's property. Everything is built so your team can continue without us.

Team: small, senior, available on signature

ENGAGEMENT LEAD · DATA & AI STRATEGY

- 15 years in analytics leadership and process manufacturing
- Has run several data and AI roadmaps for Nordic industrials
- Finnish, English
- **Available: 40% from signature**

LEAD SAP DATA ARCHITECT

- 12 years with SAP BW, Datasphere and SAC; S/4HANA data models
- **SAP Certified: Datasphere**, **SAP Analytics Cloud**
- Finnish, English
- **On call for architecture reviews (included)**

SENIOR AI / ML ENGINEER

- 9 years in ML for manufacturing and supply chain on Azure
- **Microsoft Certified: Azure AI Engineer Associate**, **Azure Data Scientist Associate**
- Finnish, English
- **Available: 80% weeks 3–10**

CVs and certificate IDs are available for verification. Any replacement must be of equal seniority and is agreed with Kemira first.

Financials

Fixed total price: €16,500 (VAT 0%)

PHASE	SHARE OF THE FIXED TOTAL
1 · Baseline	15%
2 · Use case sprint	25%
3 · Proof of value	40%
4 · 100-day roadmap	20%

- **Payment:** invoiced per phase on acceptance; 21 days net
- **Fixed price:** effort above plan is Recordly's risk
- **No licences:** uses Kemira's existing SAP and Azure environments
- Travel within Finland included

CONTRACTUAL DEVIATIONS

None. We accept Kemira's standard terms. All deliverables and code are Kemira's property.

A 100-day plan with a working result inside it.

Fixed price. Senior people who do the work. Starting on signature.
