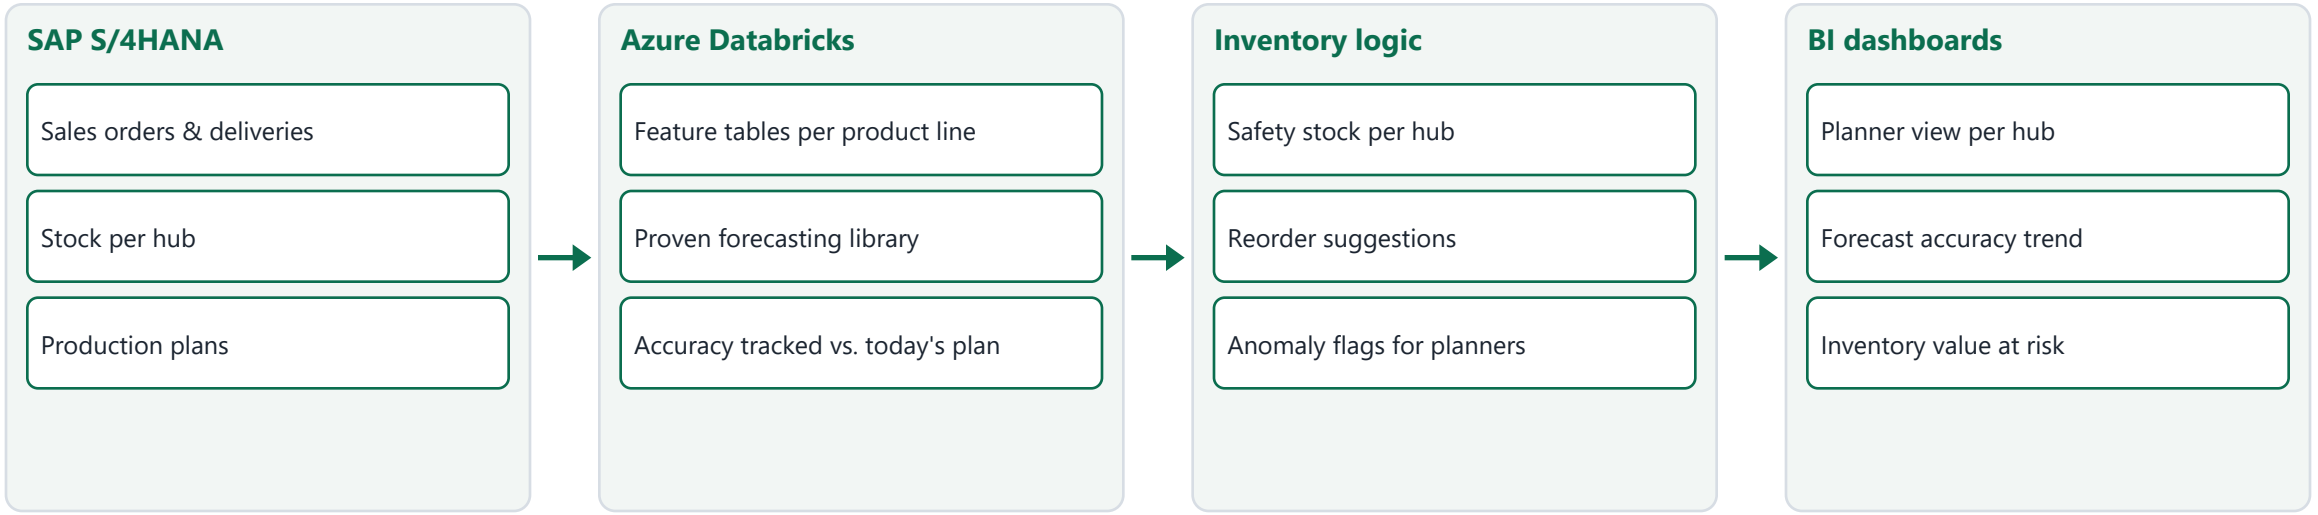
Metsä Group

Tech & architecture slides for the Metsä Group deck

Two slides for deck-writer to insert after the answer-first slide

Forecasts run on your Azure Databricks and SAP feeds, with a proven library rather than bespoke algorithms

- SAP S/4HANA demand, stock and production data feed Databricks, which runs established open-source forecasting methods. Planners see forecasts and inventory recommendations in your BI tool.
- Anomalies such as kiln incidents are flagged for planners, not modelled one by one.



Pilot first: one product line, two hubs. Scale only when forecast error beats the current plan

Buy before build: we check commercial packages first and say which wins

Option	When it wins	Our view now
Commercial planning package (e.g. SAP's planning suite)	You already license it, or planners need its workflows	Checked first in week 1
Open-source forecasting library on Databricks	Fits your stack, no new licence, low upkeep	Our default
Bespoke algorithms	Only for a gap the others cannot cover	Not proposed

Technical unknowns: data history depth per product line, hub master data quality, existing planning licences. The effort and price come from our own calculation, not from published figures.
