Tech & architecture slides for the UPM deck

Two slides for deck-writer to insert after the answer-first slide

Models reach SAP through one tested pipeline pattern, not fragile one-off scripts

- The embedded engineer builds this template in your repos in the first 30 days, then reuses it for each model.
- Every production model uses the same template: features from Snowflake + dbt, training and registry in Databricks, scored output written back to SAP S/4HANA through a staged, reconciled interface.
- No release in the days around quarterly close.

FEATURES	DATABRICKS ML	SCORING PIPELINE	SAP S/4HANA
Snowflake + dbt models	Training from the template	Scheduled batch scoring, paused in your quarterly close window	Staged write-back
Tested feature tables	Model registry with approvals	Tests on every output	Reconciled before posting
Data contracts on inputs	Drift & accuracy monitoring	Retry & alert, no silent failure	Owner per integration

> Run cost capped per pipeline and reported monthly, so compute spend cannot drift past the estimate

A pipeline goes to production only when it passes the same checklist

CHECK	WHY IT MATTERS TO UPM
Data contract + dbt tests on inputs	Upstream changes fail loudly, not at quarter close
Model registry approval by your owner	No model reaches SAP without a named sign-off
Monitoring and alert to the owner	A failing pipeline is fixed the same day
Rollback to the previous model version	Business continues if a release misbehaves
Weekly timesheet vs. agreed monthly cap, plus compute cost per pipeline	Spend stays inside the department estimate

Quarter-close dates come from your finance calendar. Every release has a named owner and a rollback.
