Tech & architecture slides for the Vahterus deck

Two slides for deck-writer to insert after the answer-first slide

VAHTERUS OY

Reports move to the cloud behind stable data contracts, so the new ERP rollout does not break them

- Today's data setup and the new ERP feed one integration layer with a contract per business object. Dashboards read a modelled reporting layer in the public cloud, not the ERP directly.
- Discovery ranks legacy apps by ROI; we replace only those where the saving exceeds the cost, top one first, in parallel until proven.

SOURCES	INTEGRATION LAYER	CLOUD DATA PLATFORM	BI TOOL
Current data setup	Light data contract per key object	Modelled reporting layer	Modernised dashboards
Legacy functional apps	ERP changes absorbed here	Version-controlled in your repo	Benefit per dashboard tracked
New ERP (rolling out)	Daily reconciliation	Every commit linked to a backlog item	Legacy report switched off

> Q1: build and test only, no production change. Go-live after Q1, date agreed against the ERP rollout plan, with rollback

We modernise in ROI order, and you can trace every commit to its benefit

- Each commit references a backlog item and its benefit measure (hours or €), visible in your repo.

CANDIDATE	ACTION	BENEFIT MEASURE	TIMING
Highest-cost legacy app	Replace	Licence and support cost removed	Build Q1, live April
Production reports	Rebuild on the reporting layer	Hours saved per month	Build Q1, live April
Low-use reports	Retire	Maintenance removed	After discovery
ERP interfaces	Contract per object	Breakages avoided	With the ERP plan

Technical unknowns: new ERP timeline and APIs, the target public cloud, current data volumes. The ranking comes from the discovery you have already held with us.
