RECORDLY

Phase 1 of your data platform: S/4HANA in Datasphere, reported in SAC, that your own engineers can read

€36,800 fixed (excl. VAT), paid per accepted milestone. Kemira's purchase agreement, no deviations.

Strategic goal	One harmonised, governed data foundation for Kemira's operations, starting with the data that matters most
Phase 1 outcome	3 S/4HANA domains (assumed: production and materials, plants, sales) flowing into SAP Datasphere on Azure, 3 SAC reports on top, in 14 weeks
Our stance	Your existing Azure, S/4HANA, Datasphere and SAC only. **No new platform, no new licences**
What makes it different	**Documentation is built with the pipeline, and your new engineers prove they can change it before we leave**
Your time	A 30-minute acceptance per milestone. No recurring status meetings; updates in your chat tool

Proposal to Rasmus Vuorinen, Director of Digital Analytics · Recordly Oy · Helsinki

Solution: S/4HANA to Datasphere to SAC, every step inspectable

Built on what you already run. Phase 2 can extend the same pattern.

LAYER	HOW IT WORKS	WHAT YOUR ENGINEERS CAN SEE
Source	S/4HANA CDS views, delta-enabled	Source-to-target mapping sheet per view
Ingest	Datasphere replication flows. Azure Data Factory only where no standard connector exists	Flow definitions in your Datasphere space, named by one convention
Model	Layered Datasphere views: raw, harmonised, reporting. Business names, owners and descriptions on every object	Datasphere lineage view plus a one-page data dictionary
Report	3 SAC stories on the reporting layer	Each KPI traced back to its source field
Control	Plant row-level security in Datasphere data access controls, inherited by SAC	Access matrix: who sees which plant, tested per milestone
Quality	**Adaptive checks**: expected ranges per plant are recalculated from recent data, instead of a static rule catalogue to maintain. Exceptions go to a named data owner	Check results in a Datasphere view

> **Out of scope, on purpose:** new tools, AI features, additional domains, dashboards beyond the 3. These belong to Phase 2, if you want it.

What went wrong before, and our safeguard

Past handovers left new engineers unable to inspect or adjust pipelines. We design against that from week 1.

PAST FAILURE	SAFEGUARD
No transparent documentation	Docs are written as each pipeline is built, in **your** repository and Datasphere, not a PDF at the end. A milestone is not accepted without its docs
New engineers could not inspect pipelines	Your engineers join from week 1 and co-build one pipeline end to end. Lineage, naming convention and data dictionary make every object readable without us
Could not adjust after consultants left	**Handover test:** a Kemira engineer who did not build it changes a pipeline (adds a field, end to end to SAC) using only our docs. Final acceptance depends on it
Knowledge sat in consultants' heads	Recorded walkthrough per domain (20 min each), a runbook for failures and reloads, and a "how to add a source" guide
Access rules unclear	Access matrix delivered and tested per milestone; no report ships without it

Delivery approach and timeline: 14 weeks, 4 milestones

WHEN	WHAT	GATE
Weeks 1-3	Source and access inventory, naming and documentation standard. **Live demo on real plant data: one S/4HANA view replicated into Datasphere and shown in SAC**	M1: go/no-go on the approach; domain scope fixed
Weeks 4-8	Domain 1 and 2 pipelines, adaptive checks, access controls, docs and walkthroughs	M2: reconciled to S/4HANA, accepted by you
Weeks 9-12	Domain 3, 3 SAC reports, access matrix tested	M3: reports accepted by business users
Weeks 13-14	Runbooks, handover test by your engineer, buffer	M4: final acceptance

> **Honest unknowns:** which 3 domains and how many CDS views (we assume about 8-10 in total), whether S/4HANA extraction is already enabled for Datasphere, and the access granted to plant data. Weeks 1-3 settle all three; M1 re-cuts scope if needed. If something needs a licence you do not own, we flag it, we do not buy it.

Core team: three seniors, replaceable on your request

ROLE	EXPERIENCE AND CERTIFICATIONS	AVAILABILITY
SAP Datasphere architect (lead)	12 yrs, BW, Datasphere, SAC. SAP Certified Associate – Data Engineer – SAP Datasphere · SAP Certified Associate – Data Analyst – SAP Analytics Cloud. Finnish, English	At signature
Senior data engineer (S/4HANA, Datasphere)	10 yrs. Microsoft Certified: Azure Data Engineer Associate · SAP Certified Associate – Data Engineer – SAP Datasphere. Finnish, English	At signature
Data engineer (SAC, quality checks)	6 yrs. Microsoft Certified: Azure Data Engineer Associate · SAP Certified Associate – Data Analyst – SAP Analytics Cloud. Finnish, English	From week 3

Two of three are at signature. **Replacement of any consultant: accepted**, handover days at our cost, equal seniority.

Price and terms

Fixed total €36,800 (excl. VAT)

ROLE	DAYS	DAY RATE
SAP Datasphere architect	10	€920
Senior data engineer (S/4HANA, Datasphere)	20	€920
Data engineer (SAC, quality checks)	10	€920
Total	**40 days**	**€36,800**

- **Paid per accepted milestone:** M1 20% · M2 30% · M3 30% · M4 20%
- **Kemira's purchase agreement, no contractual deviations**
- **No licences.** Everything runs on your Azure, Datasphere and SAC
- Effort above plan is Recordly's risk. Code, documentation and runbooks are Kemira's
