RECORDLY

Two platforms into one: 12 workloads and 12 SAC reports on Datasphere in 8 months

€55,200 fixed (excl. VAT), paid per accepted wave. Kemira's purchase agreement, no deviations.

Outcome	12 ELT workloads running in SAP Datasphere on Azure, 12 SAC reports repointed, old platforms switched off workload by workload
Method	A **migration factory**: one proven pattern, repeated per workload, in 3 waves
Stack	Your existing Azure and Datasphere only. **No new platform, no new licences**
Your development continues	Old and new run in parallel. Cut-over per workload, in freeze windows you set
Your time	One 30-minute acceptance per wave. No recurring status meetings; updates in your chat tool

Proposal to Rasmus Vuorinen, Director of Digital Analytics · Recordly Oy · Helsinki

Solution approach: one extraction method per source class

You asked us to propose the extraction solution. Week 2 confirms it on your real sources.

SOURCE CLASS	EXTRACTION METHOD (EXISTING ESTATE)	CHECK BEFORE CUT-OVER
REST APIs	Azure Data Factory REST connector, paged and incremental, into Datasphere	Row counts and checksums vs old platform
IoT event streams	Azure Event Hubs capture to Azure storage, micro-batch into Datasphere	No gaps or duplicates per time window
S/4HANA extracts	Datasphere replication flows on CDS views, delta-enabled	Delta totals match S/4HANA
Databases	Datasphere database connections; ADF where no connector exists	Full-load and delta reconciliation
LLM integration	Same Azure model endpoint, wrapped in the safeguards on slide 3	Replay test: zero repeated calls

> **Migration factory:** every workload gets the same 5 steps: inventory, build from template, parallel run, reconcile, cut over. Wave 2 and 3 reuse wave 1 templates.

What could go wrong, and our safeguard

RISK IN YOUR RFP	SAFEGUARD
Development must continue uninterrupted	Old workload stays live. Changes made there during the parallel run are replayed to the new one. Freeze only on cut-over day, agreed per workload
LLM reload creates duplicate calls and cost	Each call keyed by a hash of its input; result stored once, reloads read the store. A reload re-sends nothing already answered
LLM cost runaway	**No automated reload triggers for the LLM workload.** Every reload is started by a named Kemira owner, who sees the estimated token cost before it runs. Hard cost cap per run and per month; daily token report to the owner. Nothing burns tokens in the background unattended
Reports break or show the wrong rows	Each SAC report repointed with the workload it uses. Old vs new numbers compared before cut-over
Access rules lost in the move	Plant row-level security and Datasphere access controls recreated and tested per wave; SAC inherits them

Delivery plan: 3 waves, each accepted before the next

WHEN	WHAT	GATE
Weeks 1-2	Source inventory, extraction assessment, factory template. **Live demo: one REST workload on real plant data**	Go/no-go on methods; wave scope fixed
Wave 1, months 1-3	Assumed: 4 REST API workloads + their SAC reports	Reconciled, accepted by you
Wave 2, months 3-5	Assumed: 2 databases + 3 S/4HANA extracts + reports	Reconciled, accepted
Wave 3, months 5-7	Assumed: 2 IoT streams + LLM integration + remaining reports	Reconciled, accepted
Month 8	Buffer, runbooks, knowledge transfer, old platforms off	Handover

> **Honest unknown:** the split of the 12 workloads by source type and any source without a standard connector are not known until week 2. The week-2 gate re-cuts the waves. If a source needs a licence you do not own, we flag it then, not buy it.

Team: three seniors, replaceable on your request

ROLE	EXPERIENCE AND CERTIFICATIONS	AVAILABILITY
SAP Datasphere architect (lead)	12 yrs, BW, Datasphere, SAC. SAP Certified Associate – Data Engineer – SAP Datasphere · SAP Certified Associate – Data Analyst – SAP Analytics Cloud. Finnish, English	At signature
Senior data engineer (S/4HANA, databases, REST)	10 yrs. Microsoft Certified: Azure Data Engineer Associate · SAP Certified Associate – Data Engineer – SAP Datasphere. Finnish, English	At signature
Senior data engineer (IoT, LLM integration)	8 yrs. Microsoft Certified: Azure Data Engineer Associate · Azure AI Engineer Associate. Finnish, English	From week 3

Two of three are at signature, the majority you require. **Replacement of any consultant: accepted**, handover days at our cost, equal seniority.

Price and terms

Fixed total €55,200 (excl. VAT)

ROLE	DAYS	DAY RATE
SAP Datasphere architect	12	€920
Senior data engineer (S/4HANA, databases, REST)	30	€920
Senior data engineer (IoT, LLM)	18	€920
Total	**60 days**	**€55,200**

- **Paid per accepted wave:** weeks 1-2 assessment 20% · wave 1 20% · wave 2 30% · wave 3 30%
- **Kemira's purchase agreement, no contractual deviations:** 60 days net, delay penalty 3% per started week up to 10%, termination with 7 days' notice
- **No licences.** LLM usage runs on your Azure subscription, under your cost cap
- Effort above plan is Recordly's risk. Code, templates and runbooks are Kemira's
