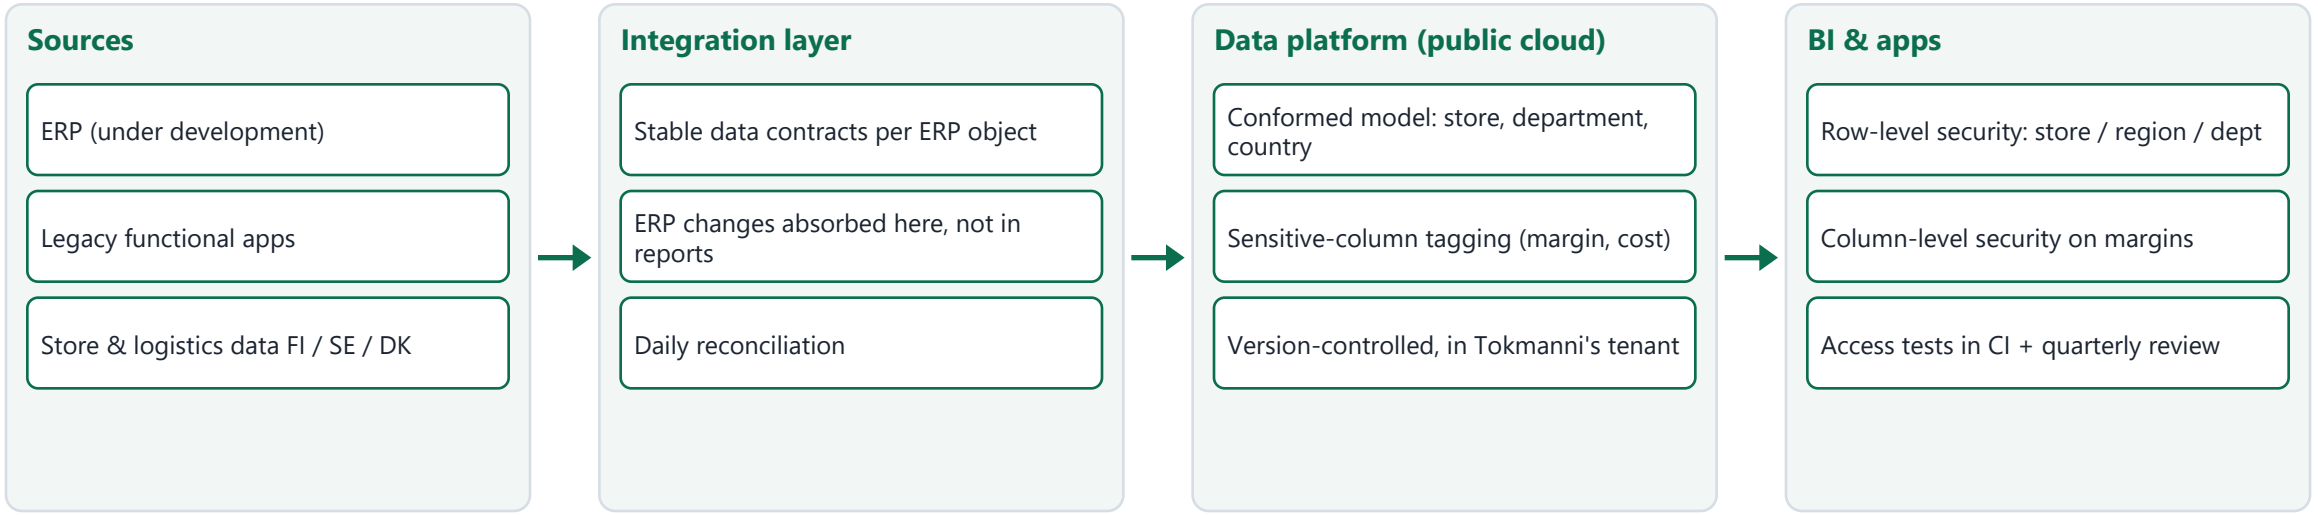
Tokmanni Group Oyj

Tech & architecture slides for the Tokmanni deck

Two slides for deck-writer to insert after the answer-first slide

Margin figures stay with the people entitled to them: access is closed by default and tested

- **Deny by default:** a new report or app shows nothing until a role grants it. Margin and purchase-price columns are classed as sensitive and hidden unless the role allows them.
- Access rules live in code, and an automated test runs on every release: "store supervisor cannot see department margin" fails the release if broken.



Legacy apps are replaced one at a time and run in parallel until the new one is proven; rollback is always available

Every retired legacy tool is tied to a cost line in the store operating ledger

Wave	Legacy tool replaced	Measured result (baseline taken first)	Go-live rule
1 (pilot)	One high-use reporting tool	Licence and hosting lines removed; manual report hours per store	Parallel run 4 weeks, no ops impact
2	Next 2–3 functional apps by ledger impact	Same metrics, reported monthly	Outside peak season (no Q4 cut-overs)
3	Remaining reporting on the new model	Total ledger lines removed vs baseline	Business owner sign-off per app

Technical unknowns we price in: how much the ERP changes during delivery (handled by the integration layer); undocumented logic in legacy apps; FI/SE/DK differences in store data. No new licences unless a wave's business case shows a net saving.
