RECORDLY

Agentic AI hackathon: working prototypes, honest limits

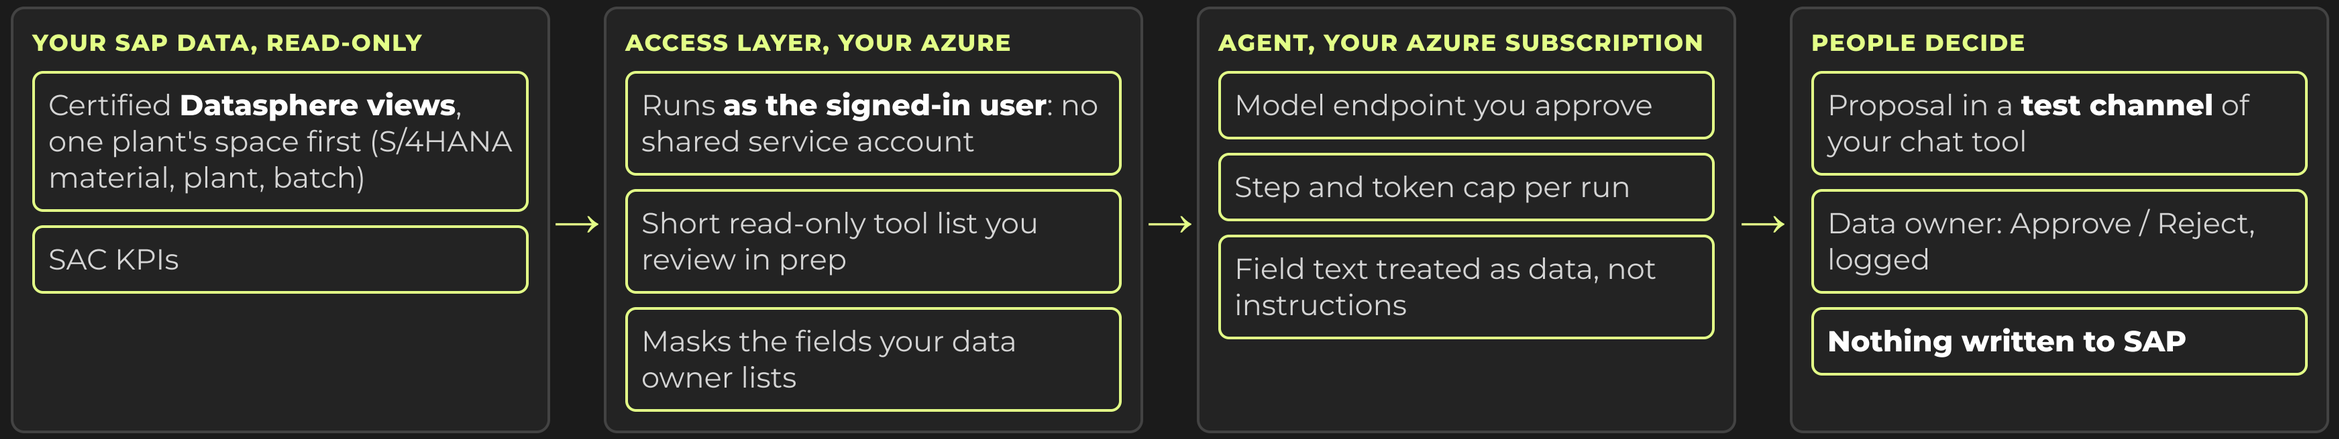

Two days on your SAP, Datasphere, SAC and Azure. €12,280 fixed. No contract deviations.

Background	An earlier pilot stalled when edge cases were glossed over and autonomy was oversold
Aim	3–4 agent prototypes your people build, tested on **real Datasphere data**, each with a written edge-case register
Our stance	Agents read governed data and **propose**; a person approves. No autonomous write-back to SAP
Your time	A 45-minute scoping call and a 45-minute readout. No recurring status meetings

Proposal to Rasmus Vuorinen, Director of Digital Analytics · Recordly Oy · Helsinki

Technical approach and deliverables

Agents read your governed SAP data and propose; a person decides. Nothing new to license.

Run log (input, tool calls, answer, approver) in your Azure tenant · code in your repo · no new platform, no new licences · production bot needs your IT approval: out of scope

Candidate workflows (chosen with you in prep): data-quality triage on Datasphere rules · KPI "why did it move" explainer · master-data anomaly queue

Deliverables: D1 seeded sandbox agent · D2 3–4 hackathon prototypes in your repo (sandbox data, not for production use) · D3 edge-case register per prototype · D4 go/no-go note per prototype

Edge cases and limits, stated up front

No promise of autonomous resolution. We measure it and report the misses.

EDGE CASE IN SAP DATA	WHAT THE AGENT DOES
Missing or duplicate master data	Flags it, **escalates to a data owner**
Unit or currency mismatch between Datasphere views or SAC measures	Refuses to compare, shows both values
Rows the user may not see (plant authorisation)	Returns nothing for them; states that results are limited by the user's authorisation, without counts
Stale or late-loaded data	States data age before answering
Conflicting sources, ambiguous request	Asks a question, never guesses
Instruction-like text inside a master-data field	Treats it as data; the agent only has read-only tools

> Each prototype is scored on a **seeded edge-case test set**, each case run 5 times: resolved, escalated, wrong. Go/no-go targets agreed in prep and confirmed after the first measurement, starting from zero wrong answers on authorisation cases.

Plan: a live agent on your data before the hackathon starts

WHEN	WHAT	TECHNICAL GATE
Prep, weeks 1–3	Scoping call, pick workflows, read-only access to **one plant's Datasphere space**, your data owner lists fields to mask and labels the edge-case set, build and test the seed agent	Wk 2: a restricted test user sees zero rows outside its authorisation. Wk 3: seed agent's first measured run; targets agreed with you. Then: **live demo on day 1, hour 1**
Hackathon, 2 days on site in Helsinki	12–16 participants (assumed) in 4 teams. Day 1 build, day 2 edge-case testing and demos	3–4 prototypes; one counts as working when it meets the agreed targets on the seeded set, with zero access leaks; unmet items listed
Follow-up, week after	Code cleanup in your repo, edge-case registers, 45-minute readout	Go/no-go per prototype: real numbers incl. misses, token cost per run, "tested on one plant only"

> **Honest unknowns, closed in prep:** (1) model endpoint and data access approved in time, otherwise the endpoint you approve and a masked extract, said on the day; (2) per-user identity into Datasphere, otherwise per-role test users; (3) final headcount and skill level. Tests re-run on every prompt, model or tool change; a per-team token cap and an Azure budget alert hold usage.

Proposed team and role requirements

ROLE	REQUIRED EXPERTISE AND CERTIFICATIONS	DAYS
Senior AI / ML engineer (lead facilitator)	ML for manufacturing on Azure. Azure AI Engineer Associate · Azure Data Scientist Associate. Finnish, English	6
Senior data engineer (SAP, Datasphere)	S/4HANA to Datasphere pipelines. SAP Certified Associate – Data Engineer – SAP Datasphere · Azure Data Engineer Associate. Finnish, English	5
SAP data architect (review)	SAP BW, Datasphere, SAC. SAP Certified Associate – Data Analyst – SAP Analytics Cloud. Finnish, English	2

Two facilitators on site both days. Any replacement is of equal seniority and agreed with Kemira first.

Price and terms

Fixed total €12,280 (excl. VAT)

ROLE	DAYS	DAY RATE	AMOUNT
Senior AI / ML engineer	6	€960	€5,760
Senior data engineer	5	€920	€4,600
SAP / AI data architect	2	€960	€1,920
Total	**13** (prep 5, hackathon 5, follow-up 3)		**€12,280**

- **Fixed price:** effort above plan is Recordly's risk. Travel and on-site days in Helsinki included
- **No licences.** Model usage runs on Kemira's own Azure subscription, with a per-team cost cap agreed in prep
- **Kemira's standard purchase agreement: no deviations.** Kemira may hire deployed consultants after 12 months **without placement or transfer fees**: accepted in full
- Payment per Kemira's standard terms, invoiced after the readout is accepted. All code and results are Kemira's property

Staffing review / Rauno: role profiles are requirements, not verified people. Confirm CVs, certificates, languages and actual availability before submission. One day = 8 hours; DE minimum EUR 115/h, DA EUR 125/h, AI expertise adds EUR 5/h for the relevant specialist. Architect base EUR 115/h is proposed for owner confirmation, not a user-supplied minimum. At most two architects. Validate fixed scope and risk allowance before commitment.

SAP architecture includes AI workshop review: 2 days at EUR 120/h. Six AI engineer days, five DE days and two architect days remain 13 days.
