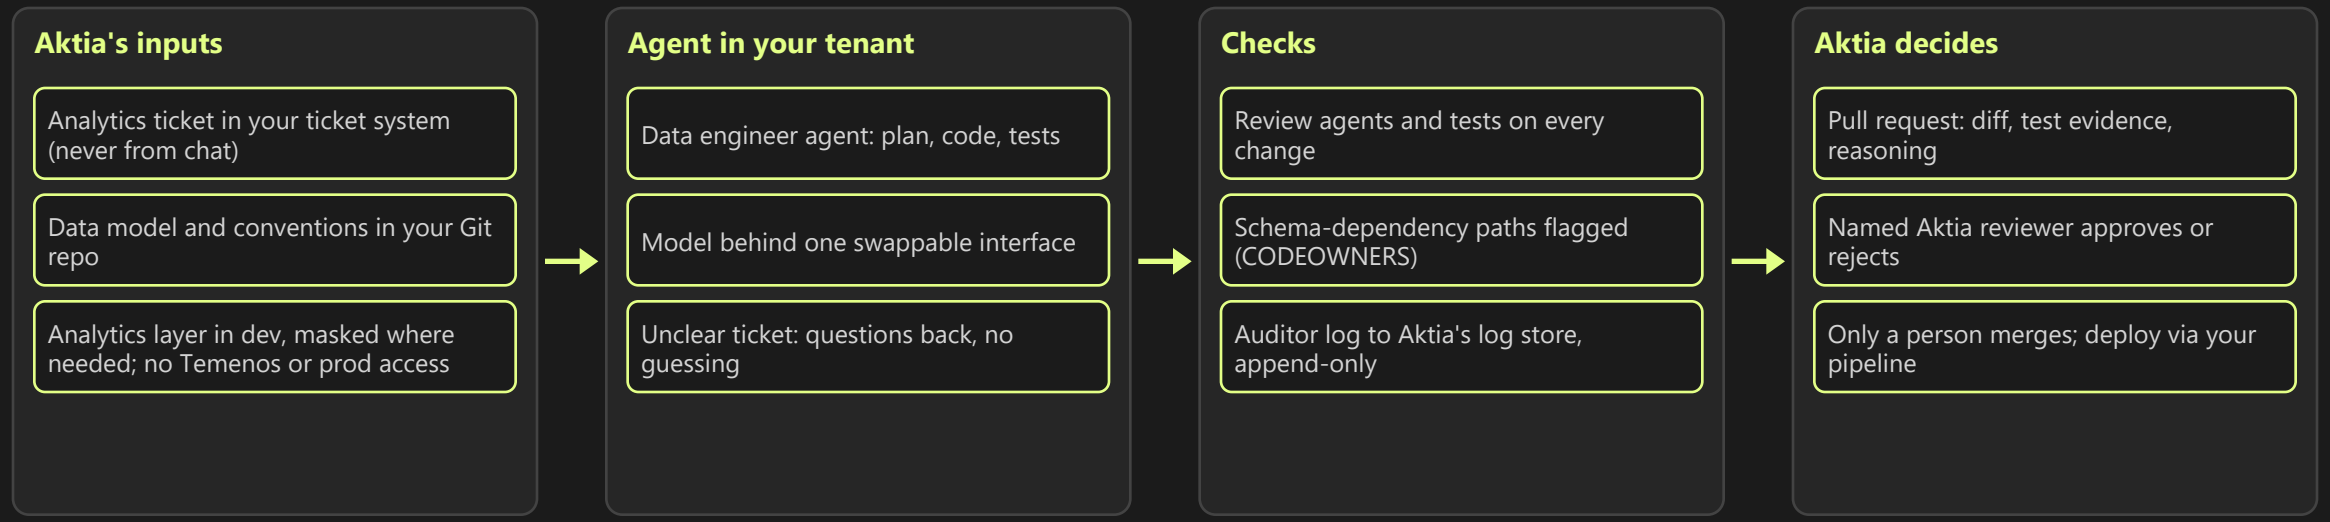
Aktia Bank

Tech & architecture slides for the Aktia deck

Two slides for deck-writer: architecture replaces the 'Technical solution architecture' slide; gates and risks goes after the compliance slide

The agent drafts, a person merges: one loop inside Aktia's tenant, with no path around review

- **No bypass, enforced technically:** the agent's identity has no approve, merge or admin right. Branch protection and CODEOWNERS are owned by Aktia admins. Schema-dependency paths also need the data owner. The reviewer is never the ticket requester.
- **Model hosting is Aktia's choice, with the residual exposure named:** open-weight model in your tenant (no external provider in the call path); EU-headquartered provider (external call, DORA register entry); hyperscaler or Snowflake-hosted model in an EU region (EU residency, but a foreign-HQ provider). One swappable interface, exit tested.
- **Stack assumed, confirmed in week 1:** on Snowflake + dbt we deploy our agent team; on another stack the agent is a new build, and scope is re-agreed at the gate.



All in Aktia's tenant and repos: Aktia-issued identities, secrets in your vault, agent writes only to its branches and a dev schema, no production credentials, kill switch

Three technical gates before the agent touches real work, and the failure risks we design for

- **Week 1, integrations:** stack, ticket system, Git host and CI confirmed; bypass test passes (push or merge as the agent identity fails).
- **Week 3, Definition gate:** hosting options run on 20 of your tickets and reported with their exposure; Aktia compliance picks one or stops. Baseline set: rework rate, review minutes, lead time.
- **Week 9, pilot gate:** approved-without-rework rate, review minutes per PR and cost per ticket vs. baseline. Targets set at week 3; a miss means stop or adjust.

Failure risk	What we do
Plausible but wrong PR; reviewer fatigue and rubber-stamping	Reasoning summary in every PR; review minutes and approval trend tracked; sampled second review
Prompt injection or vague text in a ticket	Ticket treated as untrusted input; agent can only open a PR a person rejects; unclear tickets go back
Flaky tests give a false green	Tests re-run; a pass that a reviewer rejects is counted and reviewed
Provider or model version changes behaviour	Pinned versions; test set replayed before any switch; worse result blocks release
No model option is good enough or accepted	Scope narrows to simple ticket types, or Aktia stops at the gate
Agent loops or gets stuck	Retry cap; it stops and writes what it tried

Unknowns: ticket volume and quality, ticket-system API or webhook, run cost per ticket (measured in Definition, then a monthly cap and alert). Aktia compliance signs the control matrix; we do not certify.
