RECORDLY

A certified Snowflake data engineer who keeps your satellite links free

Infor CloudSuite and mill data into Snowflake: summarised at the mill, EU-region by design, monitored from day one. €104,280 fixed, excl. VAT. Your standard terms, no deviations.

Proposal to Milla Kaartinen, Data & AI Development Manager · Recordly Oy · Helsinki

The proposal in one page

Outcome	Reliable, monitored ingestion from Infor CloudSuite and operational sources into Snowflake, ready for reporting in your BI tool
Satellite links	Raw telemetry never crosses them. Aggregated at the mill, bandwidth-capped, backfilled off-peak, one mill at a time (slide 3)
Foreign jurisdiction	EU region, customer-managed keys, data minimisation, open-format exit path. **Limits stated openly** (slide 4)
Certifications	**SnowPro Core** and **SnowPro Advanced: Data Engineer**, plus **Azure Solutions Architect Expert**. Credential IDs supplied for verification (slide 6)
Team	**Laura Heikkilä**, senior data engineer, 3 days a week, plus **Tuomas Rantanen**, solution architect, and our **Virtual Data Engineer** from month 4
Visibility	One page a month for your leadership: pipelines live, link usage per mill, data freshness, incidents
Price	**€104,280 fixed**, 6 monthly invoices of €17,380, excl. VAT

Mill telemetry is summarised at the edge, so satellite links are never saturated

1 · MILL (EDGE)

- Local collector per site
- Aggregate and compress: 1-min stats, deltas
- Store-and-forward buffer

→ only aggregates and changes

2 · CONSTRAINED LINK

- Bandwidth cap per site
- Operations traffic first
- Backfills only off-peak

→ monitored

3 · CENTRAL INGESTION

- Infor CloudSuite via ION / Data Lake
- Incremental loads, schema checks
- Monitoring and alerts

→

4 · SNOWFLAKE (EU REGION)

- Raw, modelled, reporting layers
- Customer-managed keys
- Your BI tool on certified tables

- **Rollout one mill at a time.** Link usage is measured before and after. The next site starts only if operations saw no impact.
- **Scope:** we design the pattern and pilot it at one mill. Valmet's site and OT staff install collectors; we support them.
- **Unknowns, resolved in month 1:** link capacity per mill, Infor API limits. The gate decides the cap.

Foreign jurisdiction: what we can control, and what we cannot

MEASURE	WHAT IT DOES	LIMIT WE STATE OPENLY
EU-region Snowflake account	Data stored and processed in the EU	Provider is US-headquartered
Customer-managed keys (Tri-Secret Secure)	Valmet can revoke access to the data	Needs Business Critical edition
Private connectivity, data minimisation	Only data needed for reporting leaves the mills	Design choice per data set
Open table format (Iceberg) for core data	Exit path to another platform	Migration effort if ever used
Virtual Data Engineer	Runs inside your Snowflake account on your AI credits; output is pull requests in your repositories	Uses Snowflake's AI services, so the same provider limit applies

> Unknowns: your current Snowflake region, and which data sets legal classes as sensitive. Both are settled in month 1, before any data moves.

Plan: your engineers build it with us from week 1

MONTH	WORK	LAURA	GATE
1	Site and source assessment: link capacity, Infor API limits, data classification. Conventions and pilot backlog	13 d	You approve bandwidth cap and pilot mill
2–3	Pilot mill live. First Infor and operational sources in production	26 d	Link usage before and after: no operational impact
4	Virtual Data Engineer deployed in your Snowflake. Baseline measured	13 d	Baseline accepted by you
5–6	Remaining sources, one mill at a time. Runbooks. Hand-over	26 d	Your team runs it

The Virtual Data Engineer (AI agents, running 24/7 in your Snowflake, fixed 3-month term) takes repeat work: new sources from agreed patterns, tests, failed-job root cause, schema-drift checks. Laura sets the architecture, conventions and examples it builds on and reviews its work. **A person at Valmet approves every change as a pull request.** Real result: a semi-complex pipeline built, tested and validated in 30 min instead of 12 h.

Pairing with your data team from week 1. All code in Valmet's repositories.

Team: certified, with credentials you can verify

PERSON	ROLE	CERTIFICATIONS	LANGUAGES	AVAILABILITY	DAYS
Laura Heikkilä	Senior data engineer, 3 days a week, on site in Espoo by default	**SnowPro Core · SnowPro Advanced: Data Engineer**	Finnish, English	Planned 1 Dec 2026, confirmed in writing at signature	78
Tuomas Rantanen	Solution architect: design review, 1 day a month	**Azure Solutions Architect Expert**	Finnish, English	Planned 1 Dec 2026, confirmed in writing at signature	6
Virtual Data Engineer	AI agents in your Snowflake, months 4–6	Not a person: human approval on every change		From month 4	

- **Verification:** credential IDs for each certificate are supplied with the final offer, so Valmet can check them with the issuer.
- **Replacement:** only with your approval, equal seniority, 2-week overlap at our cost. No subcontractors.

Price and terms

ITEM	EFFORT	AMOUNT
Laura Heikkilä, senior data engineer	78 days × €920	€71,760
Tuomas Rantanen, solution architect	6 days × €920	€5,520
Virtual Data Engineer, months 4–6	3 months × €9,000 flat	€27,000
Fixed total, excl. VAT		**€104,280**

- **Invoicing:** 6 × €17,380 monthly, payment per Valmet's standard terms. **No contractual deviations.**
- **Fixed price:** hours above plan are Recordly's risk. Scope changes only by your written approval.
- **Licences:** none new. Snowflake AI credits used by the agents are billed on your account and reported monthly.
