RECORDLY

Which sensor channels predict failures, and why a flag fired

A 6–8 week exploration inside your Snowflake: failure patterns, explainable maintenance indicators and a roadmap. €24,480 fixed (excl. VAT). Your terms as written, no deviations.

Proposal to Milla Kaartinen, Data & AI Development Manager · Recordly Oy · Helsinki

Solution: everything runs inside your Snowflake, on your data

WHAT WE DO

- **Read-only exploration in your existing Snowflake account.** SQL and Snowpark in a sandbox schema. No new tools, no data copied out, no external service.
- **Working demo on your real equipment data at the week-3 gate**, not slides: failure patterns found so far, with an indicator and its reason
- **Every flag carries a plain-language reason**, for example "bearing vibration 2.4x its 30-day norm for 5 days"
- Roadmap for service operations, ranked by value and effort

OUR POSITION ON PROCESS MODELLING

- **Start transparent:** per-asset baselines, thresholds, degradation trends and survival curves
- **Add statistical models only where they beat the baseline** on your history, and only if the reason stays readable
- **Physics-based models** are a roadmap option, judged on evidence
- **Out of scope:** production alerting, new platforms, dashboards, model deployment

Past failures answered

WHAT WENT WRONG BEFORE	OUR SAFEGUARD
Technicians could not understand why alert flags fired	Each indicator is rule-readable and ships with a **plain-language reason per flag**. In week 6 we run a **90-minute technician walkthrough** (Finnish or English) on real flags, inside the view they already use.
Locked work breakdowns kept auditing uninformative telemetry	**Adaptive scope:** the **week-2 data triage** scores every channel (coverage, variance, link to maintenance events) and **drops uninformative ones**. At each gate you re-prioritise the effort.
Your engineers are scarce	**Your time is capped at half a day (4 h) per week**: one 2 h review, the rest as chat questions. No pairing. We work alone between reviews.

> Honest unknown: we do not yet know how many failure events are labelled in Snowflake. The week-2 triage reports this, and the gate decides how far indicators can go.

Plan: 8 weeks maximum, three gates, three milestones

WEEK	WORK	GATE AND MILESTONE
1	Access, data inventory, confirm Q1 freeze dates	
2	**Data triage:** score every channel, drop uninformative ones	**M1** triage report
3	**Working demo on your real data**	**Gate 1 (go/no-go) · M2**
4–5	Failure patterns, indicators with reasons	**Gate 2:** re-prioritise or stop
6	Technician walkthrough, roadmap, handover	**M3** final report
7–8	Reserve if Gate 2 asks for it, same price	

Q1 change freeze: the work only reads data and writes to a sandbox schema, so it needs no production change. Roadmap go-lives are scheduled after the freeze.

Team: two seniors, fully on this

	SENIOR DATA SCIENTIST (INDUSTRIAL)	DATA ENGINEER (SNOWFLAKE)
Experience	10 years; condition monitoring, failure analysis, survival modelling	9 years; Snowflake pipelines, sensor and time-series data
Certifications	SnowPro Core · SnowPro Advanced: Data Scientist	SnowPro Core · SnowPro Advanced: Data Engineer
Languages	Finnish (native), English	Finnish (native), English
Availability	Full-time for the engagement; start date fixed at signature	Full-time for the engagement; start date fixed at signature

A senior Recordly architect reviews methods at each gate. Recordly employees only, no subcontractors.

Price and terms

Fixed total	**€24,480 (excl. VAT)** · 14 data scientist days × €960 + 12 data engineer days × €920
Invoicing	**Per accepted milestone:** M1 triage 27% · M2 week-3 demo 27% · M3 final 46% of the total
Included	Roadmap, technician walkthrough, documentation, travel to Espoo
Licences	None. Your Snowflake only. No data leaves it.
Contract	**Accepted as written: 60 days net, 3% per started week late (cap 10%), 7 days' written termination. No deviations.**

> Fixed price: effort above plan is Recordly's risk. Your staff time stays within half a day a week.
